

STONE CHIPS

Stone Chips, exactly what the name implies, chips caused by stones. Although minor and not very noticeable, if left unattended these minor chips may deteriorate and cause rust. However, repairing these minor chips will help keep that “fresh off the showroom floor” look.

WHEN CAN A STONE CHIP BE REPAIRED?

It can be repaired if the size of the stone chip does not exceed 5mm in diameter. Stone chips are fixed by using the brush touch or flowpen method. No spray painting will be done when repairing a stone chip
